Adaptivity in Learning Management Systems focussing on Learning Styles

- Supervisors:
 - Prof. Kinshuk (Athabasca University, Canada)
 - Prof. Gerti Kappel (Vienna University of Technology, Austria)

Why shall we provide adaptivity in technology enhanced learning?

- Learners have different needs and characteristics
- Adaptivity increases the learning progress, leads to better performance, and makes learning easier
- Learning Styles (Felder-Silverman)
 - Active/Reflective
 - Sensing/Intuitive
 - Visual/Verbal
 - Sequential/Global

Comparison of Adaptive Systems and Learning Management Systems

Adaptive Systems

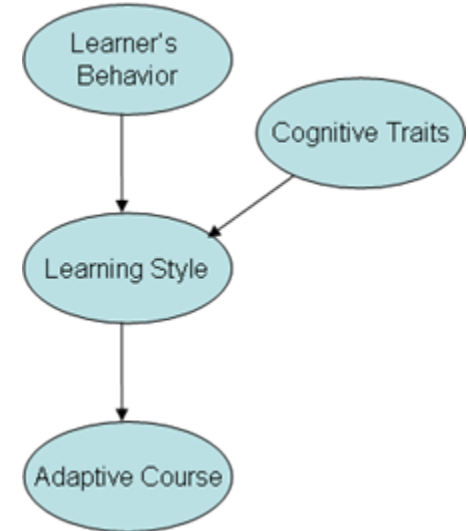

- + provide adaptivity
- lack in supporting teachers needs
- not so commonly used

Learning Management Systems

- + are commonly and successfully used
- + support teachers in creating and managing online courses
- Provide only little or, in most cases, no adaptivity

■ How to incorporate learning styles in LMS?

- How to identify learning styles?
- How to improve the detection process of learning styles by the use of additional sources?
- How to provide adaptivity based on learning styles in LMS?

■ General aims

- Developing a concept for LMS in general
- Implementing and evaluating the concept by the use of a prototype (Moodle)
- Teachers should have as little as possible additional effort

How to identify learning styles?

- By questionnaires
 - Motivate students to fill it out
 - Non-intentional influences
 - Can be done only once
- By looking at the students behaviour and actions
 - Advantages
 - Can be done automatically → no additional effort for students
 - Can be updated frequently → higher fault-tolerance
 - Problem/Challenge:
 - Get enough reliable information to build a robust student model

How to identify learning styles based on the behaviour of learners?

■ Preceding study:

Do students with different learning styles really behave differently in LMS?

■ Main Study

- Determining relevant patterns of behaviour
- Building a model for inferring learning styles from the behaviour
 - Data-driven approach
 - Literature-based approach
- Evaluation
 - 75 participants
 - Compared the difference between results from the questionnaire, the data-driven approach, and the literature-based approach

- Correctly detected learning styles:

	act/ref	sen/int	vis/ver	seq/glo
data-driven	62.50%	65.00%	68.75%	66.25%
literature-based	79.33%	77.33%	76.67%	73.33%

- Literature-based approach → suitable instrument for identifying learning styles
- Developed a stand-alone tool for identifying learning styles in LMS applying on the literature-based approach

Improving the detection of learning styles by using information from cognitive traits

- Investigated the relationship between learning styles and cognitive traits (working memory capacity) in order to get more information
- Comprehensive literature review
 - Indirect relationships between learning styles and WMC
- Exploratory Study with 39 students
 - Promising results (correlations were found)
- Main Study with 225 students
 - Relationship were discovered between WMC and active/reflective, sensing/intuitive and visual/verbal dimension

- Aimed at developing a concept which enables LMS to automatically generate adaptive courses
- Incorporates only common types of learning objects
 - Content
 - Outlines
 - Conclusions
 - Examples
 - Self-assessment tests
 - Exercises
- Adaptation Features
 - Number and position of types of learning objects

- 437 participants
- Randomly assigned to 3 groups:
 - Courses that fit to the students' learning styles (matched group)
 - Courses that do not fit to the students' learning styles (mismatched group)
 - Standard course which includes all learning objects (standard group)
- Procedure
 - Students filled out a learning style questionnaire
 - Adaptive course is automatically generated and presented
 - Students were nevertheless able to access all learning objects and take a different learning path

- Matched Group:
less time (32%) and equal grades
 - Mismatched Group:
**ask more often for additional
learning objects**
- Demonstrates positive effect of adaptivity

- Adaptivity is an important issue for supporting learners
- Extending LMS by combining the advantages of LMS and adaptive systems leads to a more supportive learning environment for learners
